AB Pregnancy-associated glycoproteins (PAGs) are antigens synthesized in the superficial layers of the ruminant trophoblast. Initially, they were identified either as proteins released into the maternal bloodstream (where they have applications in pregnancy diagnosis) (PAG1) or as molecules binding to the LH receptor (PAG2). In this study, double radial immunodiffusion was used to test the ability of antisera raised against different PAG molecules (bovine, ovine and caprine) to react with placental extracts from nonruminants (rabbit, cat, mouse, pig, and wild pig) and ruminants (cow, ewe, and goat). Placental extracts from all nonruminants tested except rabbit reacted with anti bovine PAG2 (antiboPAG2). Extracts of ruminant placentas reacted with different antisera, confirming the expression of various PAG molecules. According to the time at which the placentas were collected (early or middle pregnancy), the reaction differed as regards the thickness, position, and number of precipitation lines, suggesting that PAG expression varies as pregnancy progresses. Bos indicus and Bos taurus placental extracts

exhibited different reactions with anti-boPAG2: a single precipitation line in the former case and the both to line in the latter. This suggest differential expression of boPAG2 related glycoproteins in these two subspecies.

AR The pregnancy-associated glycoproteins (PAG) are abundant secretory products of the placental trophectoderm of ungulate species. They are structurally related to pepsin, having the capability to bind peptides. However, many cannot function as enzymes due to amino acid substitutions in and around the catalytic site. Here, we demonstrate that pigs, like cattle and sheep, but unlike equids, have multiple PAG genes. One of the transcribed porcine PAG (poPAG) genes, the one for poPAG2, was cloned. It had a nine-exon organization similar to that of other mammalian aspartic proteinase genes with an atypical TATA sequence. A total of 1.2 kbp upstream from exon 1 was sequenced. This region shared identity (> 65%) with the promoter regions of the bovine (bo) PAG1, boPAG2 and equine (eq) PAG genes, but not with other aspartyl proteinase genes, including that of pepsinogen A. Nor were there clear similarities to the promoters of other genes with trophoblast-specific expression. Of the different poPAG2 promoter constructs tested in transfection experiments in two human (JAr and JEG3) and one rat (Rcho) choriocarcinoma cell lines, only the shortest (-149 bp) was required to provide full expression of a luciferase reporter. Although this short promoter was not active in Cos-1 and L-929 cells, it was active in CHO cells, a transformed non-trophoblast hamster ovarian cell line. Co-transfection of Ets2 elevated the activity of this short promoter approximately six-fold in JAr cells, but, disruption of the two putative Ets sites did not alter the ability of Ets2 to transactivate the promoter. In the non-trophoblast cell lines, Ets2 failed to elicit any response. Ets2 responsiveness may be a common feature of most or all trophoblast-expressed genes, although in the case of poPAG2, the effect may be indirect. Copyright 2001 Wiley-Liss, Inc.

AR The pregnancy-associated glycoproteins (PAG) constitute a large family of recently duplicated genes. They show structural resemblance to pepsin and related aspartic proteinases. A total of 21 bovine (bo) PAG and 9 ovine (ov) PAG cDNA have been identified. Phylogenetic analysis indicated that the PAG are divided into two main groupings that accurately reflect their tissue expression, as determined by in situ hybridization. In the first pattern, represented by ovPAG-2 and boPAG-2, -8, -10, and -11 (where the numbering is arbitrary and reflects order of discovery within species), expression occurred throughout the outer epithelial layer of the placenta (trophectoderm). The second pattern was predominant localization to binucleate cells. Ribonuclease protection assays, which allow discrimination between closely related transcripts, have shown that the expression of PAG varies in a temporal manner over pregnancy. Of those bovine PAG expressed predominantly in binucleate cells, boPAG-1, -6, and -7 are expressed weakly, if at all, by Day 25 placenta, but are present at the middle and end of pregnancy. Others, such as boPAG -4, -5, and -9, are expressed at Day 25 and at earlier stages. Although not among the earliest PAG produced by the trophoblast, boPAG-1 has been used for pregnancy diagnosis, particularly in dairy cows, where there is a major need for a sensitive method capable of detecting pregnancy within 1 mo of conception. It seems likely that some of the newly discovered PAG will be better candidates than PAG-1 for pregnancy diagnosis.

The Pregnancy Associated Glycoproteins (PAGs) presented in this paper are AB largely expressed in the ruminant placenta. These proteins are classified as probably inactive members of the aspartic proteinase family. Pepsinogen, renin, cathepsin E & D and chymosine are typical members of this family, characterised by the presence of aspartic acids boarding the recognition sites. Secreted in the peripheral blood of the pregnant female from early pregnancy, these proteins can be used in serological tests for establishing different diagnoses. In the veterinary practice, these diagnoses are useful for both pregnancy confirmation and follow-up

of trophoblastic function. The first aspect can help breeders in the management of reproduction, while the second one more specifically concerns clinicians and researchers wishing to establish a differential diagnosis of pathologic conditions affecting pregnancy.

AB The pregnancy-associated glycoproteins (PAGs) are secretory products synthesized by the outer epithelial cell layer (chorion) of the placentas of various ungulate species. The amino acid sequences of eight PAGs have been inferred from cloned cDNA of cattle and sheep, as well as of the non-ruminant pig and horse. We compare the PAG sequences and present results of the three-dimensional models of boPAG-1 and ovPAG-1 that were constructed on the basis of the crystal structures of homologous porcine pepsin and bovine chymosin using a rule-based comparative modelling approach. Further, we compare peptide binding subsites defined by interactions with pepstatin and a decapeptide inhibitor (CH-66) modelled on the basis of crystal structures of other aspartic proteinases.

We have extended our analysis of the peptide binding subsites to the other PAG molecules of known sequence by aligning the PAG sequences to the structural template derived from the pepsin family and by making use of the three-dimensional models of the boPAG-1 and ovPAG-1. The residues that are likely to affect peptide binding in the boPAG -1, ovPAG-1 and other PAG molecules have been identified. Sequence comparisons reveal that all PAG molecules may have evolved from a pepsin-like progenitor molecule with the equine PAG most closely related to the pepsins. The presence of substitutions at the S1 and other subsites relative to pepsin make it unlikely that either bovine, ovine or the porcine PAG-1 have catalytic activity. Only two of the eight PAGs examined (porcine PAG-2 and equine PAG-1) retain features of active aspartic proteinases with pepsin-like activity. Our results indicate that in the PAGs so far characterized the peptide binding specificities differ significantly from each other and from pepsin, despite their high sequence identities. Analysis of the various peptide binding subsites demonstrates why both bovine and ovine PAG-1 are capable of binding pepstatin. The strong negative charge in the binding cleft of boPAG-1 and ovPAG-1 indicates a preference for lysine- or arginine-rich peptides. PAGs represent a family where the possible peptide binding function may be retained through their binding specificities, but where the catalytic activity may be lost in some cases, such as the boPAG-1, ovPAG-1 and the poPAG-1.

AR A sensitive and specific double-antibody RIA for a bovine pregnancy-associated glycoprotein (bPAG) is described. The limit of detection was 0.2 ng/ml. The assay was specific for bPAG in that pituitary and placental gonadotropic hormones and other placental or serum proteins assayed in serial dilutions did not cross-react. The RIA allowed measurement of bPAG in placental extracts, fetal serum, fetal fluids, and serum or plasma of pregnant cows. About 20% of unbred heifers and nonpregnant cows had detectable levels ranging from 0.30 +/- 0.09 to 0.50 +/- 0.17 ng/ml (mean +/- SD), and 15% of bull sera showed higher concentrations (3.01 +/- 1.73 ng/ml) of bPAG or bPAG-like protein. Variations among animals was observed in fetal serum bPAG concentrations. Bovine PAG was detected in maternal peripheral blood at Day 22 of pregnancy (mean +/- SD, 0.38 +/- 0.13 ng/ml) in some animals and at Day 30 in all pregnant cows. Peripheral serum bPAG levels increased progressively to 3.60 +/- 1.73 ng/ml (mean +/- SD) at Day 30 of pregnancy, to 24.53 +/-8.81 ng/ml at Day 120, and to 1551.91 +/- 589.68 ng/ml at Day 270. Peak concentration of bPAG was 2462.42 +/- 1017.88 ng/ml and it occurred 1-5

days prior to parturition. After delivery, bPAG concentrations decreased steadily to 499.63 +/- 267.20 ng/ml at Day 14 postpartum (pp), 10.12 +/-7.84 ng/ml at Day 60 pp, and 1.44 +/- 1.08 ng/ml at Day 90 pp. The undetectable concentration (less than 0.20 ng/ml) was reached by Day 100 +/- 20 pp. An investigation undertaken in Holstein heifers, Holstein cows, and Hereford cows used as recipients for purebred Holstein embryos supplied evidence of the influence of breed of recipient and sex of fetuses on peripheral concentrations of bPAG. A herd of 430 Holstein-Friesian heifers that had received transferred embryos were bled at Day 35 postestrus (pe) for measurement of bPAG. The bPAG was detected in 287 of 430 serum samples analyzed. By rectal palpation performed at Day 45 pe, 267 heifers with detectable levels of bPAG at Day 35 pe were confirmed to be pregnant as were 3 of 143 heifers previously diagnosed as not pregnant by RIA. These results suggest that detection of this placental-specific antigen in the serum could be used as a specific serological method for early pregnancy diagnosis in cattle from 28 days after breeding.

AB Sera from heifers prior to artificial insemination (AI), 1-8 days after AI, and 7 days after embryo removal were investigated by crossed immunoelectrophoresis (CIE) by use of rabbit antiserum produced against bovine early pregnancy serum and intensively absorbed with non-pregnancy serum. One precipitation peak appeared in the alpha-globulin region when sera of non-pregnant heifers were under study. An additional peak could be demonstrated in the same region when sera of early pregnant heifers were investigated. By this method 91.5% of 71 sera samples were classified correctly to be pregnant or non-pregnant. The glycoprotein character of the above two serum components could be shown by binding to concanavalin A (Con A) in lectin affinity CIE. Relative molecular weights were estimated to be about 70,000 and 80,000 for the peptides of these two proteins applying sodium dodecyl sulfate polyacrylamide gel electrophoresis of precipitates cut out from CIE-plates. As shown previously close relation of this early pregnancy associated protein (EPAP) to the early pregnancy factor is supposed because of its characteristics and its ability to

affect cellular immunity.

Inhibin, activin and follistatin are protein hormones with diverse AR physiological roles. The involvement of inhibin in the regulation of

pituitary FSH production and secretion in adult males and non-pregnant females is well established. However, it is unlikely that inhibin plays a a high degree of structural similarity to potent growth and

similar role in pregnancy in ruminants. Inhibin and activin molecules show differentiation factors of the transforming growth factor beta (TGF-beta) superfamily of peptides and their localization in a range of embryonic and fetal tissues indicates that they may thus play a role in development. Furthermore, the demonstration that follistatin is also present in a number of embryonic and fetal tissues and fluids has further implications for the actions of activin to which it binds. The role of inhibin, activin and follistatin in early development has yet to be established since gene knockout experiments have so far proved inconclusive. During mid- and late gestation, high concentrations of inhibin are found in the testes and plasma of male fetuses of sheep and cattle. Inhibin may play a role in regulating pituitary FSH release in late pregnancy, but the very high concentrations of this hormone in ovine fetal testes and in male fetal plasma compared with that observed in the fetal ovary and female fetal plasma has yet to be explained. The recent observation of high concentrations of inhibin, activin and follistatin in amniotic fluid surrounding the fetus is intriguing. Excretion via urine or lung liquid is partly responsible for the presence of these proteins in amniotic fluid. The fetal membranes and the placenta are also possible sources. It remains to be established whether these proteins constitute an inactive pool of secreted hormone or whether they have other actions in this fetal

AB Cytokines are expressed in a variety of cell types of the reproductive system, although in most instances their functions are not understood. There are, however, a few instances where a role in early pregnancy has been established. First, preimplantation conceptuses of ruminant ungulate species, such as cattle, sheep and goat, secrete a unique Type I interferon (IFN-tau). By mechanisms that are still unclear, IFN-tau prevents the destruction of the corpus luteum and hence ensures the continued production of progesterone which is essential for continuation of pregnancy. Most like the IFN-tau prevent lutcolysis by modulating the output of a luteolytic hormone, prostaglandin F2 alpha, from the uterus. Depsite this involvement in pregnancy, the IFN-tau possess similar antiproliferative and antiviral activities to other Type I IFN, 1 lambda e.g. IFN-alpha. There are 4-5 genes for IFN-tau in sheep and cattle whose promotor regions are highly conserved and distinct from those of other Type I IFN. These genens are not virally inducible and are expressed only in the trophectoderm (outer epithelium of the developing placenta) from the time of blastocyst hatching to implantation. Leukemia inhibitory factor (LIF) is a multi-functional cytokine which is expressed by uterine endometrium of pregnant mice around day 4 of pregnancy. Female mice lacking a functional LIF gene are fertile but their blastocysts fail to implant, strongly implicating the cytokine in maternal control of implantation. Colony stimulating factors (CSF) are a family of proteins (GM-CSF, CSF-1, G-CSF, and IL-3) that stimulate the cellular proliferation and induction of terminal differentiation of hemopoietic progenitor cells. CSF-1 is expressed in the uterine endometrium of the mouse and human during early pregnancy and its receptor, fms, is present on trophoblast. The osteopetrotic mouse, which represents a natural "knockout" of the CSF-1 gene, exhibits a low rate of fetal implantation and poor fetal viability. It seems likely that CSF-1 expression by the uterus influences growth and differentiation of the placenta. Although different species may utilize different strategies for ensuring developmental and endocrinological coordination between the embryo and the mother, these three examples illustrate that cytokines are likely to be major participants as autocrine factors that direct the events of early pregnancy and not simply as modulators of the maternal immune system.

AB Follicles and corpora lutea were dissected from ovine and bovine ovaries and the RNA extracted and subjected to Northern blot analyses for alphaand beta A-inhibin mRNAs, using bovine cDNA and cRNA probes. A cDNA probe

detecting mRNA for cholesterol side-chain cleavage cytochrome P-450 (P-450scc) was used as a positive control. In cattle, alpha- and beta A-inhibin mRNAs were not detected in ovarian stroma, which could potentially have contained follicles up to 0.5 mm in diameter. Inhibin-alpha and -beta A mRNAs were detected in bovine antral follicles but after ovulation, the relative levels of alpha- and beta A-inhibin mRNAs declined and were undetectable in mature fully developed cyclic corpora lutea and in pregnancy corpora lutea from early to late gestation of the cow. In sheep, alpha- and beta A-inhibin mRNAs were detected in a pool of antral follicles but not in cyclic or pregnancy corpora lutea, which did contain P-450scc mRNA. It is concluded that in cattle and sheep, follicles and not mature corpora lutea are the ovarian source of inhibin.

AB Cow conceptuses were flushed from uteri on Day 17 of pregnancy and cultured with [3H]glucosamine and [14C]leucine. A high molecular weight glycoprotein (HMWG) having an Mr = 765,000 was isolated by a combination of anion-exchange and gel-filtration chromatography. Selective chemical and enzymatic degradations were performed. The HMWG was resistant to Pronase and peptide: N-glycanase F. Only endo-beta-galactosidase and harsh alkaline reducing conditions were successful in dissociating carbohydrate from the protein core, suggesting that carbohydrate chains are N-linked to Asn and contain beta-galactosidic linkages. The intact molecule could bind to an affinity column of Datura stramoniom lectin, suggesting the presence of beta(1-4)-linked oligomers of N-acetylglucosamine. The susceptibility of HMWG to endo-beta-galactosidase suggests that at least some of these oligomers are substituted with galactose to form N-acetyllactosamine. Binding of HMWG to lectin could be inhibited partially with N-acetyllactosamine or completely with a mixture of N, N'-diacetylchitobiose and N, N', N"-triacetylchitotriose. In summary, properties of the HMWG suggest it contains lactosaminoglycan components and is almost identical to an HMWG secreted by the Day 16 ovine conceptus. Thus, embryos of these two ruminant species secrete similar molecules during early pregnancy.

AB Immunosuppressive activity was assessed in uterine flushings (UF) and uterine vein serum and plasma from nonpregnant and early -pregnant cows, and in media from the short-term culture of Day 18 bovine embryos. The preparations were tested for their ability to inhibit [3H] thymidine (3H-TdR) incorporation into phytohemagglutinin-stimulated bovine lymphocytes. On Days 2-3 (called Day 3), Days 9-10 (called Day 10), and Days 17-19 (called Day 18) of the estrous cycle (estrus = Day 0) and pregnancy, untreated and superovulated cows were anesthesized and jugular vein and uterine vein blood was collected. The uteri were removed and flushed to obtain UF and embryos. Uterine flushings were concentrated and tested for immunosuppressive activity at 400 micrograms uterine protein/ml culture fluid. Uterine flushings from both Day 18 pregnant and Day 18 nonpregnant cows were immunosuppressive (8/8), whereas Day 10 UF were usually not immunosuppressive (7/10). Day 3 UF were usually stimulatory or only marginally suppressive (8/8). Uterine vein serum and plasma from Day 18 cows were not suppressive when compared to jugular vein serum or plasma from the same cow; neither were Day 18 uterine vein serum or plasma suppressive when compared to those same samples taken from Day 3 cows. Embryo culture media obtained from the 48-h culture of Day 18 embryos was consistently suppressive. The activity was lost after dialysis in 1000-Mr cut-off tubing, removed by charcoal, and reduced by protease digestion. These results suggest two mechanisms whereby the embryo could escape immune rejection: 1) the progesterone-induced secretion of a uterine immunosuppressive substance(s) and 2) the production by the embryo of a low molecular weight immunosuppressive substance(s).

AB A new hypothesis is presented to explain the mechanism of non-rejection of a natural allograft: the mammalian fetus during early development. Using the rabbit as a model, it is proposed here that uteroglobin (UG., MM. 15,800) synthesized in the uterus during early pregnancy, crosslinks with beta 2-microglobulin (part of the H-2 and HL-A antigens) on the embryonic cell surface. This crosslinking is achieved by the enzyme transglutaminase (coagulation factor XIIIa), which has a 4--5 fold increased activity in the uterus during early pregnancy. The conversion of pre-uteroglobin (Pre-UG) to uteroglobin (UG) and pro-transglutaminase (factor XIII) to active transglutaminase (factor

XIIIa) is achieved by the concurrent increased activity of proteases present in the uterus at this time. UG is a dimeric protein with two alpha-helices running in parallel and connected by two disulfide bonds. We propose that UG molecules crosslink with beta 2-microglobulin in the presence of transglutaminase (factor XIIIa). A crosslinked beta 2-microglobulin-uteroglobin complex is formed which masks the H-2 or HL-A antigen of the implanting embryo. Thus, the maternal lymphocytes do not recognize the fetal cells as foreign. This mechanism may also explain the non-immunogenicity of ejaculated sperm in the uterus, as well as the non-immunogenicity of fetal cells found in the maternal circulation during pregnancy. At later stages of pregnancy, other proteins and/or hormones as well, may play a role in non-rejection of the fetus. However, the beta 2-microglobulin-uteroglobin complex masking the transplantation antigens of the embryo may be the major mechanism for immunological protection and non-rejection of the implanting embryo.

     Pregnancy-assocd. glycoproteins (PAGs) are structurally related
AB
     to the pepsins, thought to be restricted to the hoofed (ungulate) mammals
     and characterized by being expressed specifically in the outer epithelial
     cell layer (chorion/trophectoderm) of the placenta. By cloning expressed
     genes from ovine and bovine placental cDNA libraries, the inventors est.
     that cattle, sheep, and most probably all ruminant Artiodactyla, possess
     possibly 100 or more PAG genes, many of which are placentally
     expressed. The PAGs are highly diverse in sequence, with
     regions of hypervariability confined largely to surface-exposed loops.
     Selected PAG that are products of the invasive binucleate cells,
     expressed highly in early pregnancy at the time of
     trophoblast invasion and expressed weakly, if at all, in late gestation
     are useful in the early diagnosis of pregnancy. In a preferred
     embodiment, the invention relates to immunoassays for detecting these
     PAGs.

Pregnancy-assocd. glycoproteins (PAGs) constitute a large family of glycoproteins that are synthesized in the superficial layer of the ruminant placenta according to a spatial and temporal expression pattern. When PAGs are released in the maternal blood they can be used for pregnancy diagnosis, pregnancy follow-up and for the monitoring of the trophoblastic function. Three different RIA systems (RIA 1, RIA 2 and RIA 3) using antisera produced against PAG 167 (RIA 1), PAG55 + 62

(RIA 2) and PAG55 + 59 (RIA 3) were used in this investigation in order to measure the PAG concn. in plasma samples withdrawn from pregnant cows and heifers during different periods following artificial

insemination (AI). These systems were able to detect PAG mols. in the maternal blood as early as 21 days after AI in different concns. (RIA 1: 0.43 .+-. 0.24 ng/mL, mean .+-. SD; RIA 2: 0.48 .+-. 0.24 ng/mL; RIA 3: 0.64 .+-. 0.37 ng/mL). On days 32 and 42 RIA 2 (4.30 .+-. 1.32 ng/mL and 5.56 .+-. 1.95 ng/mL) and RIA 3 (4.17 .+-. 1.15 ng/mL and 5.60 .+-. 1.89 ng/mL) presented significantly (p < 0.0001) higher PAG concns. than those of RIA 1 (2.43 .+-. 0.81 ng/mL and 4.01 .+-. 1.48 ng/mL), resp. After day 21, significant correlations (p < 0.0001; r

.gtoreq. 0.929) were detd. between the three systems. Addnl. the three individual PAG profiles presented in this study showed that PAG mols. secreted in the maternal blood between 21 and 50 days after AI were better recognized by the RIA 2 and RIA 3 systems.

study clearly indicated that the ability of a RIA test to recognize PAG mols. in the maternal blood can be improved by carefully

selecting the antiserum. REFERENCE COUNT:

Pregnancy-specific protein B (PSPB), is secreted from binucleate trophoblast of the bovine conceptus as early as day 15 of pregnancy. The objective of this expt. was to det. if PSPB induced uterine proteins. PSPB was purified from day 120 cotyledons using antibody-based affinity chromatog. Endometrium from day 14 non-pregnant cows (n = 3) was prepd.

for explant (3H-Leu added) culture. Radiolabeled proteins released into medium were dialyzed, sepd. using 1D-PAGE, and detected using fluorog, and densitometry. PSPB (0, 0.5, 5, 25 & 50 mM) caused a concn.-dependent increase in the release of a radiolabeled 8-kba uterine protein. Western blots revealed that the 8-kDa protein cross-reacted with antibody against granulocyte chemotactic protein-2 (GCP-2). PSPB also induced release of GCP-2 by bovine endometrial (BEND) cells in primary culture. The induction of GCP-2 by PSPB was blocked by addn. of antiserum against PSPB (1:4 molar ratio). This is the first indication that PSPB has a hormonal role in inducing GCP-2, an alpha chemokine that also is induced by interferon-tau during early pregnancy.

This chemotactic cytokine may be integral to mediating adhesion, inflammation and angiogenesis assocd. with early implantation. REFERENCE COUNT: THERE ARE 25 CITED REFERENCES AVAILABLE FOR THIS 25

Bovine pregnancy-assocd. qlycoprotein 1 (boPAG1), also known as pregnancy-specific protein B was initially identified as a unique placental antigen in cattle by raising antisera against total placental proteins in rabbits. Serol. similar antigens have also been found in sheep and other ruminant ungulates. Mol. cloning showed that bo- and ovine (ov) PAG1 belong to the superfamily of aspartic proteinases, but appear to be enzymically inactive due to key mutations around the catalytic site regions. Soon after the initial cloning of ov- and boPAG1, several other PAG were identified. Here, we attempt to est, the no. of PAG-related genes and their products in the ovine placenta. The results of our expts. show that there are many PAG genes in the ovine genome and many of these are expressed in the placenta.

DOCUMENT TYPE: Journal LANGUAGE: English

A 16-kDa protein has been identified that is secreted by the bovine endometrium in response to conceptus-derived interferon (IFN) - .tau. during

early pregnancy. Because this uterine protein was similar in size to a human ubiquitin cross-reactive protein (hUCRP) that also was regulated by IFN, the authors suspected that they might be related. To test this hypothesis, uterine flushings, medium from cultured endometrium, and endometrial tissues were examd, for the presence of ubiquitin-immunoreactive proteins. Immunoreacting proteins were detected through use of 1-dimensional (1D)-PAGE and Western blotting with ubiquitin and hUCRP antiserum (1:500). A 16-kDa protein that cross-reacted with ubiquitin and hUCRP antisera was released by the endometrium and was present in uterine flushings from all day 18 pregnant females examd. The immunoreacting 16-kDa protein was absent in all nonpregnant females examd. Regulation of this uterine protein by recombinant type I IFNs (rbIFN-.tau., rbIFN-.alpha., and roIFN-.tau.), using 0, 0.5, 5, and 25 nm of each IFN, was evaluated in nonpregnant (day 12) heifers using 1D-PAGE and Western blotting. Release of the 16-kDa protein into medium was negligible in controls (0 nm IFN). For each IFN, a dose-dependent increase in release of the immunoreacting 16-kDa protein was noted. Thus, the 16-kDa protein that is produced by the endometrium in response to IFN-.tau. during early pregnancy also shares epitopes with hUCRP and ubiquitin. The 16-kDa protein has been named bovine UCRP.

In a previous study, the authors suggested that bovine EPF had a mol. wt. of 21.5 kDa because a 21.5 kDa polypeptide was not found in the nonpregnant serum, and the isoelec. point was near 5.0 by 2D SDS-PAGE using non-equil. pH gradient electrophoresis. The authors extended the study to characterize the biochem. nature of purified bovine EPF. As a result, the isoelec. point of bovine EPF turned out to be 6.3 by 2D SDS-PAGE using isoelec. focusing. Also, the purified EPF was not reduced by the addn. of 2-mercaptoethanol, indicating that bovine EPF is a monomeric peptide. Amino acid anal. of EPF was attempted, but a definitive sequence could not be confirmed. In the present study, the crude anti-EPF IgG fraction was purified by adsorption with CNBr-activated Sepharose 4B coupled with nonpregnant bovine whole serum. The purified anti-EPF IgG decreased the rosette inhibition titer of pregnant serum from 6 to 3. The Sepharose 4B affinity column coupled with anti EPF-IgG effectively isolated the EPF from pregnant bovine serum.

Endometrial explants obtained from cows on days 13-29 of pregnancy were cultured for 24 h in modified min. essential medium in the presence of [35S]methionine or [3H]leucine. Proteins synthesized and released into medium were analyzed by 2-dimensional PAGE and fluorog. Uterine luminal flushings were obtained from cyclic cows (days 2-20 of estrous cycle) and early pregnant cows (days 17-22). Endometrial tissues from cows on days 17 and 29 of pregnancy were prepd. for immunocytochem. A uterine secretory protein, which consisted of 5 isoelec. variants (pI 5.3-6.1) of identical mol. mass (23,000 Da), reacted immunol. with antiserum raised against bovine placental retinol-binding protein (bpRBP). Limited N-terminal sequence anal. of 2 major isoforms showed that the protein had nearly complete homol. with bovine placental and plasma retinol-binding protein (RBP) over the 1st 25 amino acids. Through use of bpRBP antiserum, immunoreactive RBP was detected in uterine flushings collected from cows in the late luteal phase of the estrous cycle and early pregnancy by Western blotting, and in medium conditioned by uterine explants prepd. at days 13-29 of pregnancy by immunopptn. Immunoreactive RBP was localized in endometrial surface and glandular epithelium on days 17 and 29 of pregnancy by immunocytochem. These results demonstrate that RBP is a product of bovine uterine tissues. The uterine RBP may play an important role in vitamin A transport between maternal tissues and developing embryos.

Journal English

The effect of in vitro heat stress on protein and prostaglandin synthesis and secretion by bovine conceptuses and endometrium was examd. Conceptuses and endometrium obtained on Day 17 of pregnancy were cultured at thermoneutral (39.degree., 24 h) or heat stress (39.degree., 6h; 43.degree., 18 h) temps. in medium supplemented with L-[4,5-3H]leucine (100 .mu.Ci) and arachidonic acid (10 .mu.g/mL). Radiolabeled protein secreted into the culture medium increased with time in both groups. Heat stress reduced the incorporation of [3H]leucine into intracellular and secreted proteins by conceptuses but did not alter the incorporation of [3H]leucine by endometrium. In particular, heat stress reduced by 72% the secretion of bovine trophoblast protein-1, the conceptus polypeptide believed to cause extension of the luteal lifespan. Two-dimensional, SDS-PAGE indicated that heat stress altered the array of proteins in endometrial and conceptus tissues, as evidenced by the induction of heat-shock proteins. Endometrial secretion of prostaglandin F and conceptus secretion of PGE2 increased in response to heat stress. The sensitivity of bovine conceptuses and endometrium to heat stress in vitro suggests that infertility assocd. with maternal heat stress may be caused, partially, by alterations in signals required for maintenance of the

English Bovine conceptuses removed from the uterus during the peri- and postattachment periods of placentation (days 17-24 and 26-38, resp.) were cultured in a modified min. essential medium in the presence of L-[3H]leucine to characterize in vitro synthesis of proteins released into the medium. Patterns of protein prodn. were analyzed by 2-dimensional PAGE followed by fluorog. of dried gels. Four groups of low-mol.-wt. acidic proteins (LMWAP) were obsd. to be synthesized during the peri- and postattachment periods. The no. and relative concn. of these changed with development. One group (A) consisted of 3 major and .gtoreq.2 minor isoelec. species (pI .simeq. 5.8-6.8); these were the major synthesized proteins obsd. from days 17-22. The major polypeptides of group A were present at all time points examd. through day 38 and, in several prepns., appeared as doublets [mol. wt. (Mr) .simeq. 22,000 and 24,000] through day 29 but not thereafter. Group A polypeptides from day-19 and -36 conceptus cultures were demonstrated by immunoblot anal. to cross-react with antiserum produced against ovine trophoblast protein-1. A 2nd group of proteins (Al) and a single protein (B) in the 20,000-24,000-Mr range were obsd. between days 17 and 22. These were acidic relative to group A and were not detected after day 22. A 4th group (C) of LMWAP (Mr .simeq. 14,000-18,000) was first obsd. around day 21 and appeared to increase relative to group A through day 29. One

protein from this group, C3, was the predominant LMWAP at day 38. Prodn. of numerous proteins in the 30,000-70,000-Mr range (group E) was first obsd. between days 21 and 24. Three of these, E7, E8, and E9, were acidic [pI .simeq. 5.0-5.8), with apparent mol. wts. of 30,000-45,000, and became prominent secretory products around day 29 and times thereafter. A very large (Mr >200,000) acidic (pI <4.5) protein was present from day 17 through at least day 29, and several large (Mr .gtoreq.100,000) were obsd. around day 24 and afterwards. Group A proteins have been referred to as bovine trophoblast protein-1 and implicated in events assocd. with maternal recognition of pregnancy. The present study is the first to demonstrate continued prodn. of these products beyond day 24, and to report qual. changes obsd. in bovine conceptus protein synthesis during the early postattachment period.

AB The effects of progesterone administration on conceptus development,

survival, and uterine endometrial secretion during early pregnancy in cattle was investigated. Fifty-one cyclic beef cows were mated with fertile bulls. At 36 h after the start of estrus, cows were assigned to receive sesame oil (controls) or progesterone (100 mg) on days 1, 2, 3, and 4 of pregnancy. The peripheral plasma concn. of progesterone was measured until slaughter on days 5 or 14. Cows were randomly assigned to be slaughtered on days 5 or 14 or remain intact and palpated per rectum on day 40 to verify pregnancy. Uteri on days 5 and 14 were flushed for recovery of luminal protein and conceptus tissue. Conceptus and endometrial tissues were cultured with [3H]leucine and submitted to 2-dimensional-PAGE and fluorog. Administration of progesterone increased peripheral plasma progesterone concn. on day 2-5. Conceptuses recovered from progesterone-treated cows on day 14 were advanced in development compared to conceptuses from control cows. Conceptuses recovered from progesterone-treated cows were viable as polypeptides assocd. with maintenance of pregnancy in cattle were synthesized and released at an earlier time and pregnancy was maintained beyond day 40. Early progesterone stimulation altered the synthesis and release of polypeptides from endometrial explant cultures on day 5. Apparently, progesterone plays a role in the maternal regulation of conceptus growth and development in early pregnancy of cattle.

Early pregnancy in mammals, esp. farm animals and pets, is diagnosed by the detection of protein B, a placental membrane-assocd. protein of mol. wt. 47,000-53,000 and pI .apprx.4.0-4.4, in, e.g., milk, urine, and esp. serum by. e.g., double-antibody RIA. Thus, protein B was obtained from placental membranes of dairy and beef cows by homogenization, (NH4)2SO4 pptn., anion-exchange chromatog, on DEAE-cellulose, and gel chromatog, on Bio-Gel A 0.5m. Purified protein B was conjugated to tetanus toxoid for the prodn. of antisera in rabbits and radioiodinated with 12SI for the prepn. of label. The 2nd antibody was sheep antirabbit .gamma.-globulin antiserum. In beef cows, the RIA for protein B agreed with the diagnosis by rectal palpation in 90 of 102 cases. The cut off for a pos. preqnancy test should be at least 0.15 ng and preferably at least .apprx.0.25 ng protein B/mL.

AB Uterine, luteal, and follicular responses assocd with the estrous cycle

and early pregnancy in cattle were examd. Dairy and beef cattle were slaughtered either on day 4, 8, 12, 14, 16, or 19 postestrus (estrus = day 0). Corpus luteum (CL) wt., specific PGF2.alpha. [551-11-1] binding by the luteal particulate fraction (100,000 g pellet), in vitro estradiol (I) [50-28-2] prodn. by the 2 largest follicles, total recoverable uterine luminal protein (TP), total recoverable immunoreative uterine luminal PGF (TPGF), and peripheral plasma steroids were evaluated. In a parallel study, beef cattle were slaughtered either on day 8, 12, 14, 16, or 19 of pregnancy for measurements of TP, TPGF, and plasma steroids. Uterine luminal proteins, from cyclic and pregnant cattle (day 19), were subjected to SDS polyacrylamide gel electrophoresis (SDS-PAGE) for detn. of protein mol. wts. and protein profile characterization. In cyclic cattle, CL regression was not completed by day 19. Follicle I secretion varied among animals within single day (4.0-24.0 ng

I/follicle/3.5~h);~but~not~among~several~days.~Total~PGF2.alpha.~binding~(fmol/CL)~for~days~4,~8,~12,~14,~16,~and~19~was~14.29,~145.79,~177.34,111.82, 174.51, and 199.17 resp. TPGF varied among cycle days 4 (14.4 ng), 8 (13.9 ng), 12 (19.7 ng), 14 (47.7 ng), 16 (17.4 ng), and 19 (111.0 ng). In contrast, TPGF from pregnant cattle was 481.6 and 1187.8 ng on day 16 and 19. TP (mg) in cyclic cattle varied among days 4 (7.34), 8 (7.03), 12 (4.14), 14 (15.92), 16 (5.88), and 19 (11.35). Mean TP (mg) for pregnant cattle ranged 2.73-12.09. Thirty-two protein categories were identified in cyclic cattle uterine flushings by SDS-PAGE (apparent mol. wt. range .times. 10-3 = 18.7-292.0). Proteins appeared with greater frequency later in the cycle than earlier (days 14, 16, 19: 60% vs. days 4; 8, 12: 45%). Composite SDS-PAGE profiles from days 8-12 and days 14-16 differed, suggesting luteal phase stimulation of protein secretion. Protein profiles (SDS-PAGE) from day 19 of pregnancy differed from day 19 of the estrous cycle, resembled those of midluteal phase, and revealed 4 protein constituents possibly unique to early pregnancy. Thus, uterine luminal PGF increased with luteal phase of the estrous cycle at a time when there appeared to be a stable population of specific PGF2.alpha. binding sites in the CL. Higher PGF in utero at days 16 and 19 of pregnancy and changes in TP and SDS-PAGE protein profiles may reflect responsiveness of endometrium to changes in ovarian status (cyclic) and(or) conceptus activity (pregnancy comparisons).

LANGUAGE: English SUMMARY LANGUAGE: English

Pregnancy-associated glycoproteins (PAG) are structurally related to aspartic proteinases and belong to an extensive, rapidly evolving family of recently duplicated genes expressed in the placentas of artiodactyl species. The aim of the present study was to clone PAG from the goat, study their temporal and cell-specific expression, and determine their phylogenetic relationship to PAG from other species. RT-PCR was used to generate PAG cDNA from pooled placental RNA obtained between days 45 and 115 of pregnancy. A total of 11 cDNA, which differed by > 5% from each other, were selected for complete bidirectional sequencing from 60 clones analyzed. A group of nine (caPAG1, caPAG3-7(van) caPAG9-11), which displayed >80% sequence identity with each other, were expressed after day 45 of pregnancy and were localized to trophoblast binucleate cells. These PAG demonstrated an unusually high ratio of nonsynonymous (amino acid changing) to synonymous nucleotide differences. CaPAG2, by contrast, was detectable only in early pregnancy (days 18 and 19) and expressed throughout trophectoderm. It was of more ancient origin than the PAG1 group, but more recent than caPAG8. The latter was expressed at all stages examined (days 18 to 115). The data confirm that many PAG genes, with different patterns of temporal and spatial expression, are transcribed in the placenta of the goat. The data also suggest that the recently duplicated PAG genes are being selected for rapid diversification of function. (C) 2000 Wiley-biss, Inc.

LANGUAGE: English SUMMARY LANGUAGE: English

AB This study determined effects of day of oestrous cycle and early pregnancy on sulfated glycoprotein-1 (SGP-1) expression in ovine

endometrium. A 364-bp clone of the ovine SGP-1 mRNA was amplified from reverse transcribed Day-15 cyclic endometrial mRNA using the polymerase chain reaction (PCR) and primers specific for the rat SGP-1 mRNA sequence. Nucleotide sequence of the ovine SGP-1 cDNA shared significant identity with rat SGP-1 and human prosaposin. Ewes (n = 40) were hysterectomized on either Day 1, 6, 11, 13 or 15 of the oestrous cycle or on Day 11, 13, 15, 17 or 25 of early premancy. Total cellular RNA was

isolated from endometrium and subjected to Northern and slot blot hybridization analyses using an antisense cRNA probe transcribed from the owine SGP-1 cDNA clone. A single 2.6-kb mRNA transcript was detected by Northern hybridization analyses. Slot blot hybridization analyses indicated that steady-state levels of endometrial SGP-1 mRNA varied during the oestrous cycle (cubic, P < 0.02) and increased between Day 11 and Day

25 of early pregnancy (linear, P < 0.01). On Days 11, 13 and 15, endometrial SGP-1 mRNA levels were greater in pregnant ewes than in cyclic ewes (day x pregnancy status, P < 0.01). Immunohistochemical localization of SGP-1 in uterine tissues with rabbit

anti-rat SGP-1 antibody revealed intense immunoreactivity associated primarily with the endometrial epithelium. These results indicate that the owine endometrium expresses SGP-1, a prosaposin, and that SGP-1 expression varies during the cestrous cycle and is enhanced by the conceptus. The presence ot SGP-1 in the endometrium suggests intracellular and extracellular roles for this protein in glycosphingolipid metabolism or

transport in the uterine environment.

SUMMARY LANGUAGE: English

Administration of estradiol-17.beta. (E) to ovariectomized (ovx) sheep results in the synthesis and release of an M(r) 90 000-92 000 glycoprotein into the oviductal lumen and into culture medium of ampullar explants (Biol Reprod 1992; 47:889-902). The objective of this study was to determine when and from what region of the oviduct the M(r) 90 000-92 000 glycoprotein is synthesized and released during early pregnancy. Estrous ewes were bred to intact rams of known fertility, and oviducts were obtained at estrus (Day 0) and at Days 1.5, 2, 3, 4, 6, and 16 of pregnancy. Pregnancy was verified by the presence of

a fertilized egg or developing conceptus and a functional corpus luteum. Oviductal secretions were collected by flushing oviducts with saline and by explant culture. The oviductal fimbria, ampulla, and isthmus were individually cultured (24 h) in the presence of 3H-leucine (3H-leu) or 3Hglucosamine (3H-glcN). The presence of the M(r) 90 000-92 000 glycoprotein in oviductal flushings and culture medium was determined by fluorography and Western blotting. The M(r) 90 000-92 000 protein was present in SDS gels and blots of oviductal flushings from animals through Days 4-6 of pregnancy, but not in flushings from Day 16 pregnant animals or from ovx, untreated animals. This protein was present in 3H-leu- and 3H-qlcN-labeled culture medium of the oviductal ampulla (Days 0, 1.5, 2, 3, 4, 6, and 16) and fimbria (Days 0, 1.5, 2, 3, and 4) during early

pregnancy. The M(r) 90 000-92 000 protein was not detected in oviductal ampulla or fimbria culture medium obtained from ovx animals, nor was it present in culture medium of the isthmus oviduct obtained from estrous and pregnant animals. These data show that the E-dependent M(r) 90 000-92 000 glycoprotein is synthesized and released by the oviduct in a temporally and regionally specific manner during early

pregnancy as the gametes and fertilized egg are traversing the tube and prior to a systemic rise in progesterone.

SOURCE:

Bacterial cell walls contain peptidoglycan (PTG), which, among other

actions, induces fever. The present experiment evaluated the effects of PTG treatment on early pregnancy and blood plasma concentrations of reproductive hormones. Ewes were injected i.v. with saline or 15, 30 or 60 .mu.g kg(-1) sonicated PTG (Streptococcus pyogenes) on day 5 after mating. Each dose of PTG induced fever. Pregnancy rate at day 25 was not related to incidence of fever but tended to differ among treatments (control, 100%; low, 100%; medium, 67%; high, 60%; P < 0.08). Combined pregnancy rate in ewes from control and low dose groups (100%) was greater than that in ewes from medium and high dose groups (64%, P < 0.01). Ewes with high 13, 14-dihydro-15-keto-prostaglandin F(2.alpha.) (PGFM) concentrations had lower pregnancy rates (6 of 10) than those with low concentrations of PGFM (11 of 11; P < 0.05). Mean cortisol concentrations were higher in treated (2.8 .+-. 0.28 .mu.g dl(-1)) than in control (1.1 .+-. 0.03 .mu.g dl(-1)) ewes (P < 0.01); the pattern of secretion was biphasic and increased in all treated ewes (P < 0.01). Neither means nor profiles of oestradiol differed with treatment. Mean concentrations and the pattern of concentrations of progesterone were reduced in all treated ewes, as indicated by the time by treatment and linear interaction with treatment (1.2 .+-. 0.1 versus 1.6 .+-. 0.1 ng ml(-1), P < 0.01). Patterns of LH pulses did not differ from 0 to 4 h or 24 to 28 h after treatment; mean plasma LH concentration was lower in ewes treated with 0, 15 or 30 .mu.g PTG kg(-1) than with 60 .mu.g PTG kg(-1) (P < 0.01). Pregnancy status was not related to plasma concentrations or patterns of LH, oestradiol, progesterone or cortisol. Inflammatory mediators, such as PGF(2.alpha.), may act directly on the embryo or uterus in ewes treated with PTG.

Early embryonic losses are much higher in nuclear transfer (cloned) pregnancies, and this is a major impediment to improving the efficiency of cloned animal production. In cattle, many of these losses occur around the time of placental attachment from the fourth week of gestation. We studied the potential for altered immunologic status of cloned pregnancies to be a contributing factor to these embryonic losses. Expression of major histocompatibility complex class I (MHC-I) by trophoblast cells and distribution of endometrial T-lymphocyte numbers were investigated. Six 5-wk-old cloned pregnancies were generated, and 2 others at 7 and 9 wk were also included, all derived from the same fetal cell line. All 8 cloned placentas displayed trophoblast MHC-I expression. None of the 8 controls (4-7 wk old) showed any MHC-I expression. The percentage of trophoblast cells expressing MHC-I varied in the clones from 17.9% to 56.5%. Numbers of T lymphocytes (CD3+ lymphocytes) were significantly higher in the endometrium of the majority of cloned pregnancies compared with controls. In the cloned pregnancies, large aggregates of T cells were frequently observed in the endometrium in addition to increased numbers of diffusely spread subepithelial lymphocytes. As trophoblast MHC-I expression is normally suppressed during early gestation, the observed MHC-I expression in the cloned pregnancies is likely to have induced a maternal lymphocytic response that would be detrimental to maintaining viability of the cloned pregnancy. These findings support a role for immunologic rejection in the syndrome of early

ISSN: 0022-0302.

DOCUMENT TYPE: LANGUAGE: Article English

LANGUAGE: English SUMMARY LANGUAGE: English AB The Early Conception Factor (ECF) test is a commercially available

qualitative assay that reportedly detects a pregnancy-associated glycoprotein present in bovine serum within 48 h after conception. One concern with previous assessments of this test is that animals with viable embryos early during pregnancy that subsequently undergo embryonic loss before pregnancy diagnosis increase the rate of false-positive results and bias the assessment. To preclude this possibility, noninseminated Holstein cows (n=9) and heifers (n=8) were evaluated as an unequivocal source of nonpregnant animals, and Holstein cows (n=17) and heifers (n=1) inseminated at estrus and in which at least one embryo of transferable quality was recovered at a nonsurgical flush 6 d after artificial insemination were evaluated as an unequivocal source of pregnant animals. Blood samples were collected from all animals 6 d after estrus, which was immediately before embryo collection in

pregnant animals. Each serum sample was evaluated using two ECF test cassettes (tests 1 and 2), and the result of each test cassette was interpreted by two independent readers (readers I and 2). Test

sensitivity, specificity, positive predictive value, negative predictive value, and accuracy were 86, 4, 49, 23, and 46%, respectively. Although the observed agreement between readers (91% for test 1; 89% for test 2) and between tests for the same serum sample (94% for reader 1; 91% for reader 2) was high, the overall rates of false-positive and false-negative ECF test results were 96 and 14%, respectively. We conclude that the ECF test is an unreliable method for determining pregnancy status of dairy cattle on day 6 after estrus.

DOCUMENT TYPE: Article LANGUAGE: English SUMMARY LANGUAGE: English

Different RIA systems available for measuring the concentrations of

pregnancy-associated glycoproteins (PAGs) in dairy goats were compared in order to evaluate their accuracy in early

pregnancy diagnosis. Plasma concentrations of PAGs were determined by 3 heterologous RIA systems with a bovine PAG standard and

tracer in combination with antisera anti-ovine PAG (RIA 1), anti-caprine PAG55+62 (RIA 2), anti-caprine PAG55+59 (RIA 3), and by 2 homologous RIA systems that employed caprine PAG55+62 and caprine PAG55+59 and their specific antisera (RIAs 4 and 5, respectively). In all of the RIAs, the mean concentrations of PAGs were significantly higher (P<0.01) in pregnant than in nonpregnant goats from Day 21 onwards after breeding. On Day 21,

the accuracy rates of early pregnancy diagnoses were 56% (RIA 1), 96% (RIA 2), 99% (RIA 3), 95% (RIA 4) and 90% (RIA 5), whereas on Day 28 these rates were >99% for RIAs 2, 3, 4 and 5. The RIAs for PAGs depend on proteins from theplacenta being present in maternal plasma and require only a single sample of blood, to distinguish pregnant

goats from those that fail to return to estrus for other reasons. The homologous and semi-heterologous assays are highly accurate as

early as Day 21 of pregnancy.

ISSN: 1031-3613. DOCUMENT TYPE: General Review

LANGUAGE: English AB This review considers the potential reduction of embryo mortality in vitro and in vivo in ruminants. Data on cytokines provided by different fields of reproductive immunology and biology were collated. Because of the crucial importance of the local interactions between the embryo and its dam, the expression of growth-factor and cytokine genes was analysed in the embryo proper, trophoblast, oviduct and endometrium by reverse transcriptase polymerase chain reaction in sheep and in cattle during the pre- and periimplantation periods. Many deleterious cytokines, such as tumour necrosis factor-alpha, interferon-gamma (IFN-gamma), interleukin-2 (IL-2), and beneficial cytokines, such as transforming growth factor-beta, leukaemia inhibiting factor, colony-stimulating factor-1 (CSF-1), ganulocyte-macrophage CSF, IL-1, IL-3, IL-4, IL-6, IL-10 and IFN-tau appeared to be involved in embryo survival in ruminants and other species. Their administration is efficient in a murine experimental model (CBA/J times DBA/2) of embryonic and fetal mortality. For instance, recombinant ovine IFN-tau (roIFN-tau) injected at the moment of implantation drastically reduces embryonic mortality in this model. In ruminants, roIFN-tau and recombinant bovine IFN-tau are very efficient in maintaining progesterone luteal secretion in cyclic animals. The involvement of IFN-tau in the mechanisms of maternal pregnancy recognition are particularly detailed in relation to inhibition of 13,14-dihydro-15-keto-prostaglandin F-2alpha (PGFM) pulses and oxytocin uterine receptivity. A synthetic model of the anti-luteolytic effects of IFN-tau on the endometrial cell is proposed. Finally, the particular potential of serum pregnancy-specific proteins (PSPs: PSPB, PSP60, pregnancy-associated glycoprotein) for monitoring embryo survival, with examples given for cattle and sheep is underlined.

SUMMARY LANGUAGE: French: English

AR Isolation and partial characterization of an ovine Pregnancy-Associated Glycoprotein (oPAG) An ovine Pregnancy-Associated

Glycoprotein (oPAG) has been isolated from fetal cotyledons by the means of ammonium sulfate precipitations and different liquid chromatographies. The bovine PAG was used as standard and tracer to monitor the oPAG in each step of isolation. Ovine PAG seems to be an heterogeneous group of glycoproteins of molecular mass ranging from 47 to 67 kD. Molecular cloning of its cDNA revealed that ovine and bovine PAG share 86% nucleotide sequence identity and both belong to the aspartic proteinase family (gtoreq 50% amino acid sequence identity to pepsin and cathepsins D and E). However neither bovine nor ovine PAGs do not appear to be enzymatically active. The oPAG's cDNA codes for a polypeptide of 382 amino acids long that is synthesized by trophoblastic binucleate cells since day 18 post conception and detected in maternal circulation since day 24 p.c. The detection of oPAG could be used for early diagnosis of pregnancy and determination of early embryonic mortality in sheep and other domestic and wild ruminants.

DOCUMENT TYPE: Article LANGUAGE: Hungarian

SUMMARY LANGUAGE: Hungarian; English

Accurate and early detection of pregnant and

nonpregnant animals has become a key to good breeding management because it is an essential factor for monitoring and controlling fertility in food animals and horses. One of the most recent techniques for early

pregnancy diagnosis in cattle, pigs and horses on the

farm is the B-mode ultrasonography. The author makes acquainted with the papers (4a-4d) published together with his coworkers and abstracts (4e-4i) presented at different congresses in English which deal with the accuracy of early pregnancy diagnosis in cattle, pigs

and horses made by the first battery-operated, portable ultrasonic scanner. The scanner was made by a Hungarian invention in Canada. For detecting the pregnant/nonpregnant animals, the ultrasonic method gives a high accuracy: between the 25th to 29th day in the cattle, the 23rd to 24th day in pigs, after the artificial insemination, and between

the 20th to 24th day in horses after the mating. In cattle the determination of bovine pregnancy associated

glycoprotein may help in the detection of false diagnoses.

DOCUMENT TYPE: Article LANGUAGE: English

The oviduct controls the environment in which the gametes are transported and fuse, and in which embryonic development begins. The ultrastructural topography of the ampulla and isthmus is similar, consisting of ciliated and secretory cells, but a different array of proteins is secreted by each segment along with various serum components. Amino acids are selectively secreted by the oviduct; these amino acids probably interact with the

gametes or embryo to facilitate the processes of fertilization and development. An oviduct-specific glycoprotein is synthesized by the ampulla of sheep and cattle in response to oestrogen and secreted mainly from day - 1 to day 3 of the ovarian cycle. This oestrus-associated glycoprotein (EGP) has a variable molecular

mass of 80-97 kDa and a pI value ranging from 4.7 to 5.5. The

bovine (b) and ovine (o) EGP genes are 95.5% identical and consist of 1560 base pairs encoding 519 amino acids containing one N-linked and several O-linked glycosylation sites. The terminal glycosides are N-acetylglucosamine and galactose-N-acetylgalactosamine for bEGP, and fucose, galactose and sialic acid residues are also identified for oEGP. EGP binds to zona pellucida and blastomere membranes, but evidence for EGP binding to sperm membranes is equivocal. After in vitro fertilization the proportion of sheep oocytes cleaving was increased in the presence of oEGP, but when single-cell embryos were cultured with oEGP, these cleavage rates were reduced. In addition, consistent positive effects of oEGP were observed on blastocyst formation. Elaboration of the mechanism of synthesis of EGP, its action and its role in fertilization and embryo development is important for our understanding of the events of early pregnancy.

The bovine trophoblast protein-1 complex, a major secretory

product of the day 17 to 18 conceptus, has been implicated in extension of

luteal lifespan during early pregnancy. This

glycoprotein complex, identifiable by immunoprecipitation procedures utilizing rabbit antiserum to ovine trophoblast protein-1, exists as seven isomers of two size classes (22 and 24 kDa). Culture of

embroys with tunicamycin demonstrated that the isomers are N-linked glycoproteins, as deglycosylated products migrate as a single band (18 kDa) during electrophoresis. Culture with deoxymannojirimycin indicated that the 24 kDa form is complex in nature, whereas treatment with endoglycosidase H and lectin chromatography indicated that the 22 kDa form is a high-mannose type glycoprotein. These results indicate that molecular weight variants of bovine trophoblast protein-1 arise as a single translation product that undergoes differential post-translational glycosylation.

AB The radioimmunoassay available for pregnancy-specific .beta.1-

glycoprotein (SP1) was tested for its ability to detect pregnancy prior to the 1st missed menstrual period. The equine serum, used as solvent for the standards, did not react like human serum. The standard solvent was replaced by bovine serum albumin, 50 g/l, and pooled human serum, respectively. Equilibrium and sequential incubation procedures were compared. The latter appeared to be more sensitive in the low value range and was more suitable for the early detection of pregnancy. With standards in albumin, the sequential assay was

more specific. SP1 could be detected in sera of men and non-pregnant women using albumin as standard solvent. This could be due to different cross reacting material of the protein matrix or to the presence of SP1-like material in human sera. The choice of human male serum seemed most practical.

NOVELTY - Determining the amount of progesterone (I) in raw milk of cows comprising contacting the milk with a biosensor, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) a system comprising a biosensor connected to a computer for performing the new method; and

(2) use of a biosensor for determining the amount of (I) in raw milk of cows.

USE - The method and biosensor are particularly applied to cows and are used to indicate when they are in heat (for timing of insemination) or in-calf (detecting an early pregnancy

), or if they have some defect in the reproductive system (claimed).

ADVANTAGE - The method provides automated, reliable and inexpensive determination of (I) content, over the whole of the concentration range 0-40 ng/ml. 0-40 ng/ml.

NOVELTY - A therapeutic polypeptide (I) selected from MA (undefined), pro MA (pMA) and other fully defined sequences as given in the specification, is new.

DETAILED DESCRIPTION - (I) selected from an isolated polypeptide: (a) consisting of MA or pro MA (pMA);

(b) comprising fully defined sequences of peptide MA, pMA, MA(S1), MA(S2), MA(S3), MA(S5), MA(S9), MA(S10), or MA(S11) (P1-7) (synthetic mimetics of MA peptides), beta human chorionic gonadotrophin (beta hCG) 55-58, beta hCG 55-90, beta hCG 55-91, beta hCG 55-74, beta hCG 6-37, beta hCG 6-39, or beta hCG 6-40 (P8-11); or

(c) functional equivalents of (a) or (b), is new.

INDEPENDENT CLAIMS are also included for the following:

(1) a fusion polypeptide comprising (2 or more) (I) joined via a covalent bond to a heterologous polypeptide;

(2) a peptide isolated from early pregnancy urine

comprising MA/pMA;

(3) an isolated nucleic acid (II) encoding (I);

(4) an expression vector (III) comprising (II) operably linked to a promoter;

(5) a cell (IV) comprising (III);

(6) an isolated antibody (V) or its fragment which specifically binds to (I);

- (7) a cell producing (V), produced by fusion of an immortal cell line to an immunoglobulin-cell producing plasma cell producing the monoclonal antibody;
- (8) an anti-idiotype antibody which binds to a variable domain or
- (9) a fragment of HUSI-II (undefined) comprising an SH3 motif and flanking residues e.g., 40-46, 40-60, 40-59, 40-58, 40-66, 40-67, 40-68;
- (10) expanding (M1) blood cells in vitro comprising contacting blood cells with (I);
- (11) providing (M2) blood cells comprising administering the blood cells expanded by M1;
 - (12) detecting (M3) MA/pMA in a biological sample;
 - (13) purifying (M4) MA/pMA in a biological sample;
- (14) producing (M5) a peptide library for screening for a therapeutic effect from anti-human immunodeficiency virus (HTV) effects, anti-cancer effects, anti-wasting effects, radioprotective effects, anti-angiogenic effects, anti-inflammatory effects and pro-hematopoietic effects; and
- (15) identifying (M6) peptide having one or more of anti-HIV effect, anti-cancer effect, anti-wasting effect, radioprotective effect, and pro-hematopoietic effect.
- ACTIVITY Anti-HIV; cytostatic; virucide; antibacterial; antirheumatic; antiarthritic; antidiabetic; immunosuppressive; hepatotrophic; neuroprotective; antiinflammatory; dermatological; antianemic; antidiarrheic; vulnerary; vasotropic; osteopathic; immunostimulant; antiparasitic; fungicide; ophthalmological. Simian immunodeficiency virus (SIV) (MAC251) induces disease in rhesus monkeys similar to acquired immunodeficiency syndrome (AIDS) in humans only with much greater rapidity. Therapy with purified MA of 3 monkeys with end-stage disease infected 13-14 mos earlier was initiated when the animals were losing weight, highly viremic (plasma virus 0.5 to 3 multiply 10 to the power of 6 copies of SIV RNA/ml by nucleic acid sequence based amplification (NASBA)), and developing pancytopenia. Treatment of these monkeys with end-stage AIDS with MA at 0.2 mg/kg dose 3 times weekly produced no significant change in SIV titer over 6 mos. observation period. However, in this period none of the 3 animals died. In contrast, most untreated animals died by this period. Also crude urinary preparations containing MA, but not crude fractions lacking MA, were inoculated subcutaneously. Using a 10 to the power of (4.5) TCID(50) of cell free SIV(mac251), the characteristic rise in SIV P27, reduction of CD4+T-cells, and weight loss, which occurred in the untreated animals, was prevented in MA treated animals. The untreated animals died before 6 mos. The treated animals were maintained for 7 mos without weight loss, with normal CD4+ T-cell counts, and barely detectable plasma p27 (less than 5 ng/ml in contrast to over 200 ng/ml in control animals). However, stopping therapy led to rapid onset of virus production and development of AIDS-like disease.

MECHANISM OF ACTION - Angiogenesis inhibitor; gene therapy.

USE - (I) is useful for inhibiting HIV replication. (I) is useful for treating or preventing:

(a) human immunodeficiency virus (HIV) infection;

- (b) cancer such as brain, breast, lung, pancreatic, prostate or renal cancer, or hematopoietic malignancy, preferably Kaposi's sarcoma where (I) is administered:
 - (i) in conjunction with radiation therapy; or
- (ii) prior to, contemporaneously with or after anticancer chemotherapy, or radiation therapy;
- (c) a condition characterized by loss of body cell mass in a subject, such as wasting associated with HIV infection, cancer, or hematopoietic deficiency;
- (d) a condition associated with pathological angiogenesis, e.g., angiogenesis associated with neoplasm; or

- (e) hematopoietic deficiency:
- (i) resulting from failure or dysfunction of normal blood cell production and/or maturation; or
- (ii) associated with neoplastic disease of a hematopoietic origin, malignancy, malignant disease of hematopoietic organ, autoimmune condition, trauma, radiation exposure (associated with medical therapy or anticancer therapy, where the polypeptide is administered prior to, after or contemporaneously with the radiation).
- (I) is also useful in ex vivo gene therapy which involves removing cells from the subject, treating the cells with a pro-hematopoietic polypeptide to provide an expanded and/or differentiated set of cells, where the pro-hematopoietic polypeptide is (I), transforming cells and/or expanded and/or differentiated cells with a therapeutic expression vector to provide transformed cells, and returning transformed cells to the subject. The method further involves increasing the blood count of at least one class of blood cells in the subject by administering to the subject (I). The therapeutic vector used in the above mentioned method expresses a polypeptide which is dysfunctional or lacking in the subject, or a polypeptide which produces a therapeutic effect in the subject. The cells which are removed from the subject are preferably hematopoietic cells (all claimed). (I) is also useful for treating bacterial infections, chronic diarrhea, anemia, autoimmune disease, rheumatoid arthritis, diabetes, chronic hepatitis, systemic lupus erythematosus, wound, burn, inflammation (especially of the cornea), osteoporosis, parasitic infections and fungal infections. Dwg.0/17

NOVELTY - A composition (I) for testing pregnancy of an animal, comprises an antibody to an early pregnancy factor (EPF) of an

animal conjugated to a label. DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the

following: (1) a test device (II) for detecting an animal EPF, comprising:

(a) a porous solid phase material capable of conveying a liquid sample in a fluid flow direction generally parallel to the length of the test device;

(b) sample receiving zone within the porous solid phase material, where the sample and other assay reagents may be contacted with the device; and

(c) an antibody zone within the porous solid phase material, comprising an immobilized antibody to the EPF of the animal disposed at a downstream location from the sample receiving zone;

(2) isolating (III) an antibody to an EPF, comprising injecting a biological fluid comprising EPF of the animal to another animal which is capable of producing antibody to the biological fluid, isolating antibodies and removing non-early EPF antibodies;

(3) a liquid sampling tube, comprising a base portion having an inlet for allowing a liquid sample to enter into the tube, a body portion having at least one opening and a top portion for enclosing the tube; and

(4) a bovine pregnancy testing kit (IV), comprising a bovine pregnancy test device and a liquid sampling tube.

USE - (I) or (II) is useful for determining pregnancy of an animal, especially a cow which is pregnant for less than 100 days, especially from 20-40 days, by obtaining a liquid biological sample such as urine, saliva, milk, perspiration (or their combinations), preferably serum and testing for the presence of EPF in the sample (claimed).

ADVANTAGE - The pregnancy detection method facilitates early detection of the pregnancy as early as

30-48 hours after insemination. Dwg.0/6

8908668 A UPAB: 19930923 New protein, designate PSP (pregnancy serum protein) 60 and specific for pregnancy in mammals, has an N-terminal sequence of formula X-Gly-Ser-X -Leu-Thr-Thr-His -Pro-Leu-Arg-Asn-Ile -Lys-Asp-Leu-Val -Tyr-Met-Gly-X -Ile-Thr-Ile-Glv -Thr-Pro-Pro-Gln -Glu-Phe-Gln-Val-Val-Phe-Asp -Thr-Ala-Ser-X-(X is probably Asn). PSP60 has mol wt about 60.000

(polyacrylamide electrophoresis under denaturing conditions) and isoelectric point about 5.5.

USE - Detection of PSP60 in the blood (esp of ruminants) provides early detection of pregnancy, while a

decrease in its concn is indicative of death of the embryo. It is detected by immunoassay with specific mono- or polyclonal antibodies. 0/6

Method for producing early pregnancy factor (EPF) from any mammalian cell source comprises growing a selected cell which produces EPF in a culture medium to produce a supernatant medium contg. EPF and other prods. and harvesting the supernatant medium to obtain the EPF. The cells may be choriocarcinoma cells, human myeloma cells or human lymphoblastic cells. The purified EPF may be used to produce monoclonal antibodies.

USE - The antibodies can be used to detect EPF in human serum or urine for pregnancy diagnosis, e.g. in a home pregnancy testing kit or for detecting pregnancy in the horse and cattle industries and in the preservation of endangered species.

(1) Isolated pure bovine pregnancy antigen for detecting and determing, pregnancy in cattle consists of a glycoprotein (I) obtd from a pregnant bovine animal is new.

(I) binds adenine dinucleotide; it has immunoreactive portions of molecular wt. 158000-263000; it contains N-acetylglucosamine, galactose and L-fucose and D-mannose and/or D-glucose; it has an isoelectric point of 4.5-5.5; and it gives a blue stain with Coomassie blue.

(I) produces an antibody to which bovine luteinising hormone, haemoglobin, albumin, IgG, fibrinogen fetuin and alpha-fetoprotein are not cross-reactive. (2) Monoclonal antibody produced by a hybridoma formed by fusing cells from a mouse myeloma line and spleen cells from a mouse previously immunised with (I), and with which the antibody reacts, is new. The hybridoma is esp. ATCC HB 8846. USE/ADVANTAGE - The antigen and/or antibody are used for the

detection and supervision of bovine pregnancy at an early stage. Blood, urine, milk or tissue extract from the bovine is tested for the antigen by contact with antiserum to it. 0/2

In an early pregnancy test for agricultural animals,

(a) a heterologous antiserum against early pregnancy

serum of the species to be tested is prepared, and (b) the antiserum is absorbed with non-pregnant serum of the same species and subsequently used in a crossed immunoelectrophoresis or other serological in vitro detection method.

- Systematic early detection of pregnancy in farm animals (especially cattle, pigs and sheep), for monitoring of fertility and early recognition of sterility problems. Simple, rapid and cheap test giving sure diagnosis of pregnancy even in the pre-implantive phase. 0/0

The cattle are injected subcutaneously with 2000-3000 units (mouse) units (800-1200 international units) on the 16th or 32nd day after insemination. 60-80 days after insemination rectal examination shows no hormonal stimulation in pregnant cattle. Non-pregnant cattle show positive stimulation.

USE/ADVANTAGE - More efficient early diagnosis of

pregnany esp. in longhorned cattle.

Typically, injections with Gravohomone preparate do not cause abortion and give high effectivity of early diagnosis of pregnancy, Bul. 5/7.2.84.

Method of monitoring pregnancy in milk-producing livestock (esp. dairy cattle) comprises determining the concn. of estrogen conjugates

(I) in a sample of (or derived from) the milk of the animal, and comparing the result with the av. concn. of (I) in milk from non-pregnant animals of the same species.

The test is based on the fact that the concn. of (I) in milk from pregnant animals is significantly higher than in milk from non-pregnant animals. It can be performed on a routine basis and provides an early indication of pregnancy (within 15-20 days of insemination); it also provides a measure of the health of the foetus in the later stages of pregnancy.

AB DE. 2551431 A UPAB: 19930901

New anti-embryo serum is produced by immunizing >=1 animals with a homogenate of embryo or selected embryo parts, embryo extract, purified embryo fractions or the blood of pregnant animals, unimportant antibodies being removed by selective adsorption of tissue homogenates other than embryos, uteri, ovaries and teh blood of pregnant animals. Procedure for the diagonosis of pregnancy in animals involves the use of antiserum thus produced in the testing of mammalian blood using methods which permit the detection of antigens, pref. agglutination agglutination inhibition, precipitation and/or radioimmunological methods. Used in early detection of pregnancy in animals such as sheep, cattle horses, pigs, dogs and goats as well as in humans. Unlike pregnancy tests involving the measurement of HCG, the new method is highly specific and does not give false positive results in the presence of such non-pregnancy conditions as hydatiform moles, choricadenoma or choriccarcinoma.

PRIORITY APPLN. INFO: DE 1962-S302187 19621005

DE 1492157 B UPAB: 19930831

Compn. for early detection of pregnancy in domestic animals,

conting, androgens and estrogens in an amount adapted to the animal species.

Early detection of pregnancy in such non-menstruating

domestic animals as horses, cattle and pigs in which pregnancy

otherwise difficult to detect in the early stages.

The pref. route of administration is by i.m. injection. Between the 12th and 17th days after mating (optimally on the 15th or 16th day), the female animal is injected with an androgen estrogen mixture in an experimentally determined

species-specific dosage. The timing of the injection is less critical if long-acting steroid esters are used. If the animal is not pregnant, powerful manifestations of estrus appear between the 20th and 24th day. If estrus does not appear, this is taken as an indication that the animal is pregnant. This diagnostic method has no effect on the fertility of the ova of non-pregnant animals and no effect on embryonic development in pregnant animals.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the cotal score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      A. ```

This sequence represents bother preparion yearchied plycopicetin (PAD) borbod. Mos are structurally related to pepsins, hought to be festificated to uppels memant, and are specifically copressed MATIORS 500 tem highly diverse in sequence. With resistors of hypervaliability Interply confined to surface expected long. Mypervaliability Interply confined to surface expected long assected Rosa (eg. borbod) that are products of invasive binnelset expensed lightly on early despending the time of the sequence of the second of th rhinoceros, horse, cat, dog and human (all claimed).

Length 379; 73.9%; Score 1484; DB 20; 74.7%; Pred. No. 3.1e-147; 34; Mismatches Matches 284; Conservative Sest Local Similarity Query Match

379 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              352 WILGDAFLRRYFSVFDRGNDRIGLA 376 SwissProt_40:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
